

# An always present visual routine

Smartwatch and mobile app

## I Research

The need that teens and young adults with autism have of a **ever-present visual routine** was found through observation, data collection, interviews and experimentation in their homes and educational institutions. Shown to the right is part of a study done to establish what activities are part of the users daily routine and the time it takes to finish each activity.

Wake up, get up, get dress, make bed.

⌚ 15 to 20 minutes

Brush teeth, wash face, quick shower.

⌚ 10 to 15 minutes

Prepare breakfast, eat , wash dishes.

⌚ 30 minutes

Gross motor activities, take walk.

⌚ 15 to 20 minutes

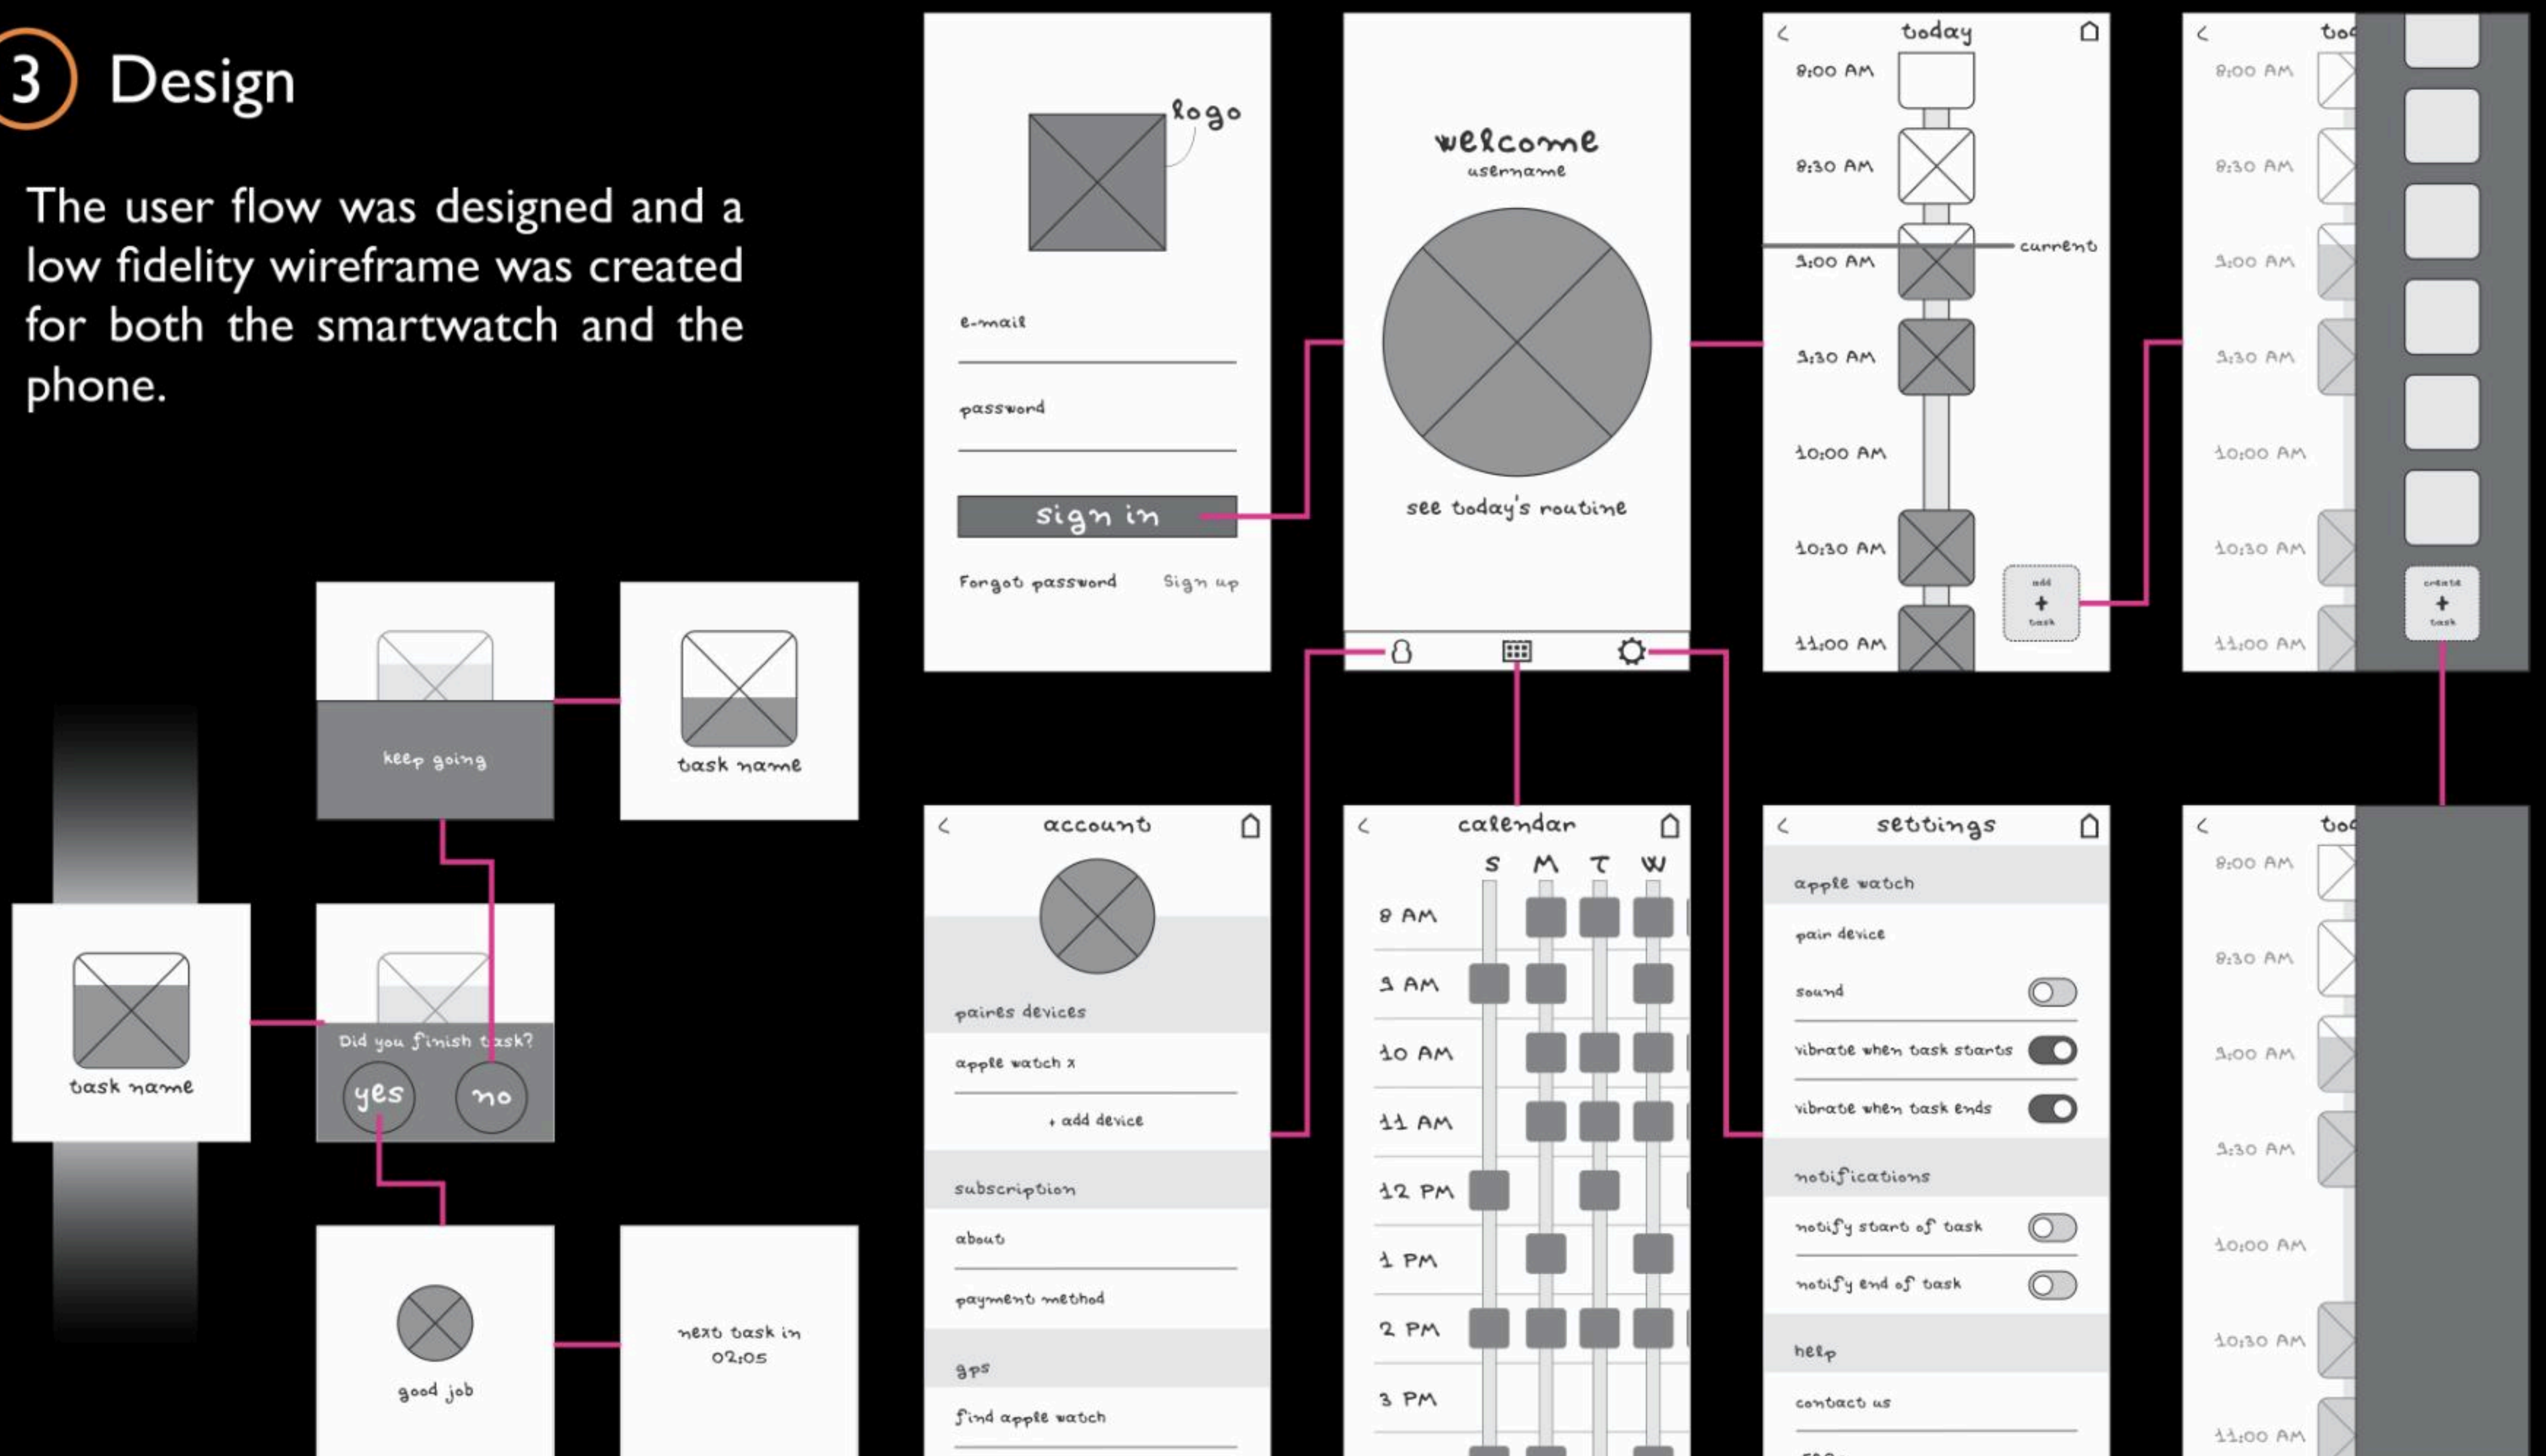

## 2 Ideation

A usage scenario was built to describe how the user will interact with the system in the timeline shown above.

## 3 Design

The user flow was designed and a low fidelity wireframe was created for both the smartwatch and the phone.

## 4 Prototype

The research report and the static wireframes were used to design the interface and interactions on both the mobile app and the smartwatch app. The prototypes were later used to test the products with the final user.
